

“Proprietary Coal Bed Methane Drilling Fluid”

**Drill horizontally
in coal
with confidence**

The CBMax System is a proprietary system specifically designed to meet the Western Canadian Sedimentary Basin drilling challenges in coal, especially those experienced in horizontal wells.

It is effective in either fresh or salt water mud and has been used by nine major WCSB Operators to drill more than 60 long reach Hz CBM wells.

At TD, after running liner, the system is easily broken with the addition of “Q Break” to remove residual mud from producing cleats and fractures.

Applications:

- Drilling fluid for wet or dry coals, vertical or horizontal
- Coring fluid to extract competent, undamaged coal cores

Benefits:

- Non-damaging, non-invasive
- Environmentally friendly
- Proprietary technology
- Improved coal-bed stability
- Easily broken with minimal “skin” for low lift-off during completion
- Easy to handle mud in a wide range of properties that cover all down hole operations

CBMaxSystem™

To date, over 60 Hz CBM wells were successfully drilled for various operators in the following areas:

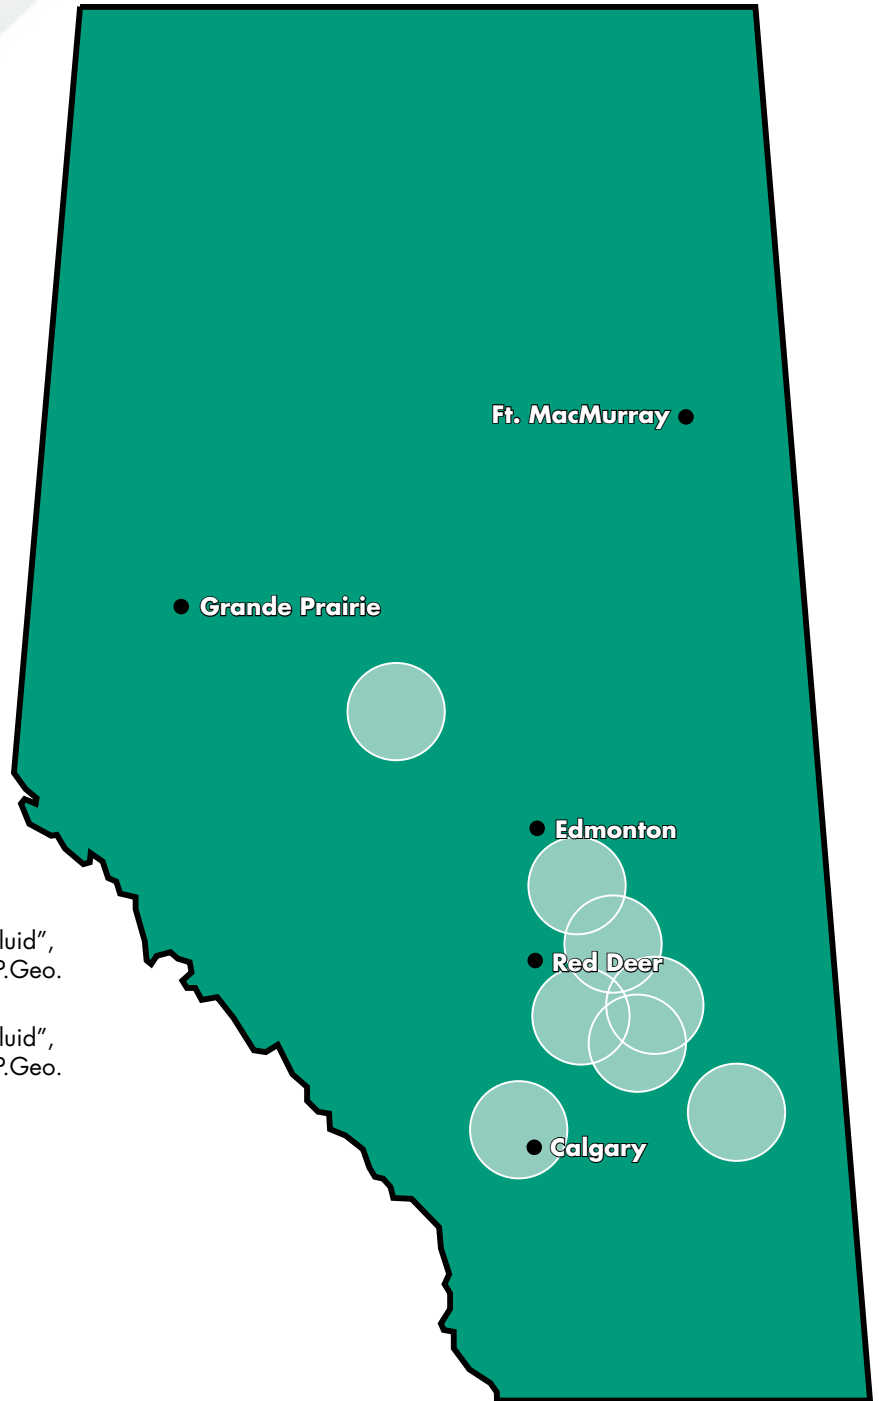

Richdale
Oberlin
Crossfield
Bashaw
Fenn West
Fenn Big Valley
Virginia Hills
Mikwan
Wetaskawin
Leahurst
Erskine
Clive
Twinning
Three Hills Creek
Nevis
Elnora
Ewing Lake
Wimbourne
